Data Store

Introduction

The Data Store is a Catalyst Cloud Scale component that serves as a cloud-based relational database management system for storing your application's persistent data, including backend information

ability to perform operations like creating tables, modifying records, setting field characteristics, and managing data efficiently is powered by Catalyst, ensuring scalability, reliability, and seamless integration with other services. You can perform these actions by clicking a few buttons, or you

in ZCQL to manage the data operations.

You can also set scopes and permissions for each table in the Data Store. They define the availability of the table's data and the levels of access granted to various user roles for each table. The Data Store works with APIs and your
